# Class 14: RNASeq Mini-Project

Aadhya Tripathi (PID: A17878439

## Background

The data for today's mini-project comes from a knock-down study of an important HOX gene.

## Data Import

Import counts data and metadata:

```
countData <- read.csv("GSE37704_featurecounts.csv", row.names = 1)
colData <- read.csv("GSE37704_metadata.csv", row.names = 1)
```

Quick look at the imports:

```
head(countData)
```

```
                length SRR493366 SRR493367 SRR493368 SRR493369 SRR493370
ENSG00000186092    918         0         0         0         0         0
ENSG00000279928    718         0         0         0         0         0
ENSG00000279457   1982        23        28        29        29        28

SRR493370      hoxa1_kd
SRR493371      hoxa1_kd
```

### Data Cleanup

Remove `length` column in `countData`:

```
countData <- as.matrix(countData[,-1])
```

Check if the `countData` columns and `colData` rows match:

```
colnames(countData) == rownames(colData)
```

```
[1] TRUE TRUE TRUE TRUE TRUE TRUE
```

Remove genes with no expression:

```
countData = countData[rowSums(countData) > 0, ]
head(countData)
```

```
                SRR493366 SRR493367 SRR493368 SRR493369 SRR493370 SRR493371
ENSG00000279457        23        28        29        29        28        46
ENSG00000187634       124       123       205       207       212       258
ENSG00000188976      1637      1831      2383      1226      1326      1504
ENSG00000187961       120       153       180       236       255       357
ENSG00000187583        24        48        65        44        48        64
ENSG00000187642         4         9        16        14        16        16
```

## DESeq Analysis

### Setting up the DESeq object

```
library(DESeq2)
```

Build the required DESeqDataSet object for DESeq analysis:

```
dds <- DESeqDataSetFromMatrix(countData = countData,
                              colData = colData,
                              design = ~condition)
```

```
Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in
design formula are characters, converting to factors
```

### Running DESeq

Run DESeq on dds:

```
dds <- DESeq(dds)
```

```
estimating size factors
```

```
estimating dispersions
```

```
gene-wise dispersion estimates
```

```
mean-dispersion relationship
```

```
final dispersion estimates
```

```
fitting model and testing
```

### Getting Results

Save results from running DESeq:

```
res <- results(dds)
head(res)
```

```
log2 fold change (MLE): condition hoxa1 kd vs control sirna
Wald test p-value: condition hoxa1 kd vs control sirna
DataFrame with 6 rows and 6 columns
                baseMean log2FoldChange     lfcSE       stat      pvalue
               <numeric>      <numeric> <numeric>  <numeric>   <numeric>
ENSG00000279457   29.9136      0.1792571 0.3248216   0.551863 5.81042e-01

ENSG00000188976 1651.1881     -0.6927205 0.0548465 -12.630158 1.43990e-36
ENSG00000187961  209.6379      0.7297556 0.1318599   5.534326 3.12428e-08
ENSG00000187583   47.2551      0.0405765 0.2718928   0.149237 8.81366e-01
ENSG00000187642   11.9798      0.5428105 0.5215598   1.040744 2.97994e-01
                     padj
                  <numeric>
ENSG00000279457 6.86555e-01
ENSG00000187634 5.15718e-03
ENSG00000188976 1.76549e-35
ENSG00000187961 1.13413e-07
ENSG00000187583 9.19031e-01
ENSG00000187642 4.03379e-01
```

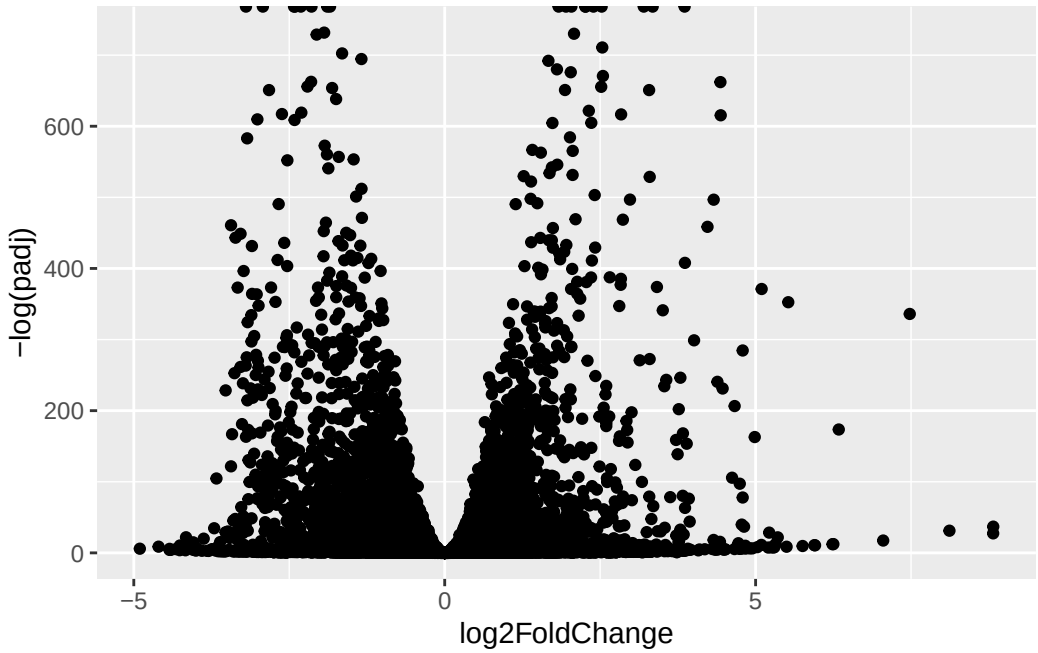
## Visualization: Volcano Plot

```
library(ggplot2)
```

Create basic volcano plot of Log2 Fold Change vs -Log of Adjusted P-value in DESeq results:

```
ggplot(res) +
      aes(x=log2FoldChange,
          y=-log(padj)) +
      geom_point()
```

```
Warning: Removed 1237 rows containing missing values or values outside the scale range
(`geom_point()`).
```

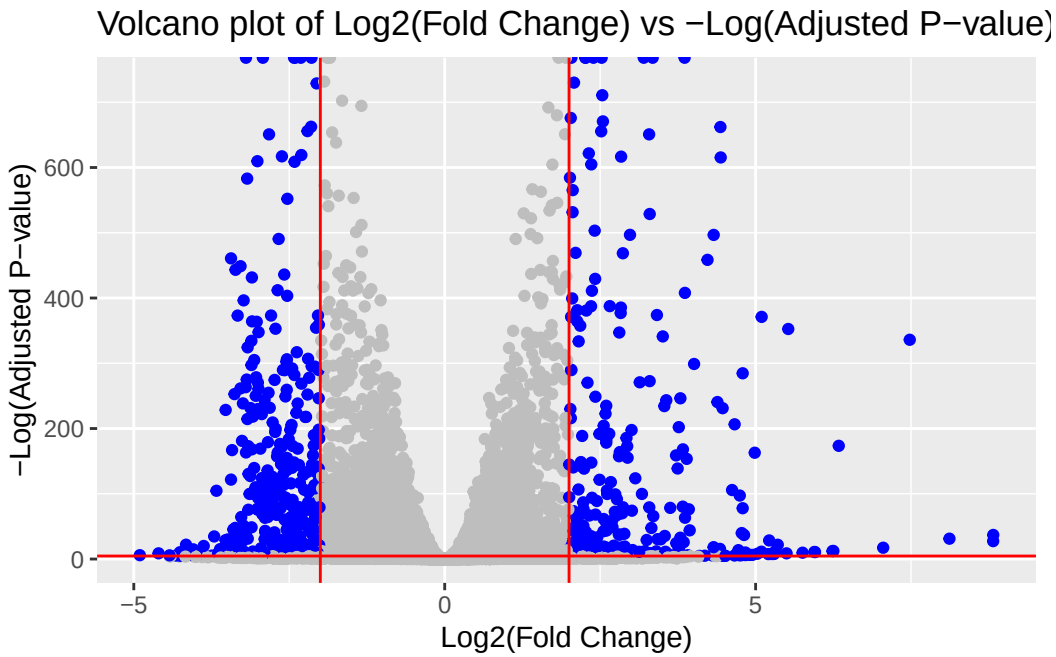


Improve the plot with color and lines to highlight significant changes.

```
my_cols <- rep("gray", nrow(res))
my_cols[abs(res$log2FoldChange) > 2 ] <- "blue"
my_cols[res$padj>=0.01] <- "gray"
```

```
ggplot(res) +
      aes(x=log2FoldChange,
          y=-log(padj)) +
      geom_point(col=my_cols) +
      geom_vline(xintercept = c(-2,+2), col="red") +
      geom_hline(yintercept = -log(0.01), col="red") +
      labs(x = "Log2(Fold Change)",
           y = "-Log(Adjusted P-value)",
           title = "Volcano plot of Log2(Fold Change) vs -Log(Adjusted P-value)")
```

```
Warning: Removed 1237 rows containing missing values or values outside the scale range
(`geom_point()`).
```



Save the results of DESeq analysis to a csv file:

```
write.csv(res, file="results.csv")
```

### Add Annotation

```
library("AnnotationDbi")
library("org.Hs.eg.db")
```

List of all available key types for mapping:

```
columns(org.Hs.eg.db)
```

```
 [1] "ACCNUM"       "ALIAS"        "ENSEMBL"      "ENSEMBLPROT"  "ENSEMBLTRANS"
 [6] "ENTREZID"     "ENZYME"       "EVIDENCE"     "EVIDENCEALL"  "GENENAME"
[11] "GENETYPE"     "GO"           "GOALL"        "IPI"          "MAP"
[16] "OMIM"         "ONTOLOGY"     "ONTOLOGYALL"  "PATH"         "PFAM"
[21] "PMID"         "PROSITE"      "REFSEQ"       "SYMBOL"       "UCSCKG"
[26] "UNIPROT"
```

Add columns to `res` to save information on the SYMBOL, ENTREZ ID, and gene names.

```
res$symbol = mapIds(org.Hs.eg.db,
                    keys=rownames(res),
                    keytype="ENSEMBL",
                    column="SYMBOL",
                    multiVals="first")
```

```
'select()' returned 1:many mapping between keys and columns
```

```
res$entrez = mapIds(org.Hs.eg.db,
                    keys=row.names(res),
                    keytype="ENSEMBL",
                    column="ENTREZID",
                    multiVals="first")
```

```
'select()' returned 1:many mapping between keys and columns
```

```
res$name =   mapIds(org.Hs.eg.db,
                    keys=row.names(res),
                    keytype="ENSEMBL",
                    column="GENENAME",
                    multiVals="first")
```

```
'select()' returned 1:many mapping between keys and columns
```

Quick look at res with the new columns:

```
head(res)
```

```
log2 fold change (MLE): condition hoxa1 kd vs control sirna
Wald test p-value: condition hoxa1 kd vs control sirna
DataFrame with 6 rows and 9 columns
                 baseMean log2FoldChange     lfcSE       stat      pvalue
                <numeric>      <numeric> <numeric>  <numeric>   <numeric>
ENSG00000279457   29.9136      0.1792571 0.3248216   0.551863 5.81042e-01
ENSG00000187634  183.2296      0.4264571 0.1402658   3.040350 2.36304e-03

```

Save the annotated results to a csv file:

```
write.csv(res, file="results_annotated.csv")
```

## Pathway Analysis

```
library(pathview)
```

```
##############################################################################
Pathview is an open source software package distributed under GNU General
Public License version 3 (GPLv3). Details of GPLv3 is available at
http://www.gnu.org/licenses/gpl-3.0.html. Particullary, users are required to
formally cite the original Pathview paper (not just mention it) in publications
or products. For details, do citation("pathview") within R.

The pathview downloads and uses KEGG data. Non-academic uses may require a KEGG
license agreement (details at http://www.kegg.jp/kegg/legal.html).
##############################################################################
```

```
library(gage)
```

```
library(gageData)
```

## KEGG

```
data(kegg.sets.hs)
data(sigmet.idx.hs)

kegg.sets.hs = kegg.sets.hs[sigmet.idx.hs]
```

Create foldchanges vector, which is needed for `gage()`

```
foldchanges <- res$log2FoldChange
names(foldchanges) <- res$entrez
```

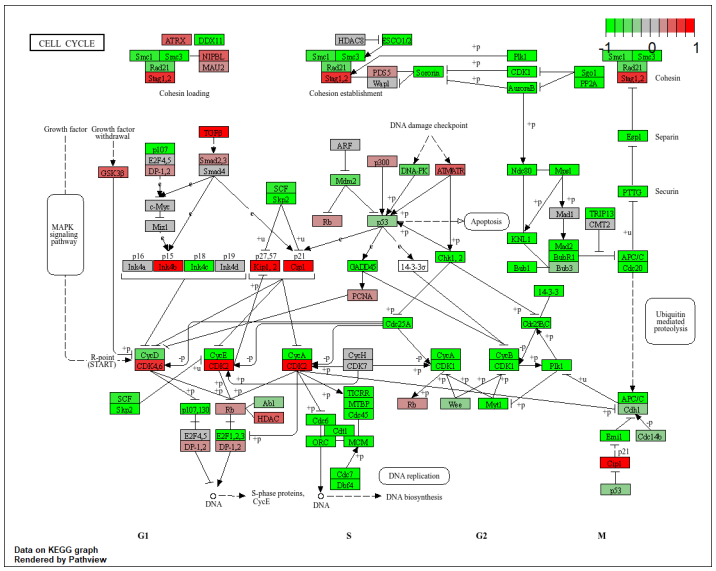
```
keggres <- gage(foldchanges, gsets=kegg.sets.hs)
```

```
pathview(gene.data=foldchanges, pathway.id="hsa04110")
```

```
'select()' returned 1:1 mapping between keys and columns
```

```
Info: Working in directory C:/Users/extra/Documents/school/BIMM 143/class14
```

```
Info: Writing image file hsa04110.pathview.png
```



## GO

```
data(go.sets.hs)
data(go.subs.hs)
```

```
# Focus on Biological Process subset of GO
gobpsets = go.sets.hs[go.subs.hs$BP]

gobpres = gage(foldchanges, gsets=gobpsets)
```

```
head(gobpres$less)
```

```
